Course Description

1. Course Objective: To provide the student with basic knowledge about digital signal processing and the mathematic methods used within this field

2. Learning Outcomes
   a. Categorize digital systems based on their properties (such as linearity, time invariance, causality, memory, invertibility, and BIBO stability)
   b. Identify basic properties of convolution and compute the convolution of discrete signals
   c. Explain the significance of convolution in the context of discrete LTI systems
   d. Use the properties of the Fourier and Z transforms in problem solving.
   e. Evaluate forward/inverse Fourier and Z transforms of discrete signals
   f. Demonstrate competency in working with both time- and frequency-domain representations of discrete signals and systems
   g. Design a discrete time filtering algorithm based on given requirements
   h. Use Matlab effectively for the analysis of digital signals and for the design of basic digital systems
   i. Explain the significance of the sampling theorem and use it in the context of discrete processing of continuous time signals

3. Syllabus
   a. Introduction
   b. Complex Analysis
   c. Discrete-Time Signals and Systems (Section 2.1-2.5)
   d. The Fourier Series and Fourier Transform (Section 2.6-2.9)
   e. The Z Transform (Section 3.0-3.3)
   f. Applications of the Z Transform (Section 3.4-3.7)
   g. Sampling of Continuous-Time Signals (Section 4.0-4.5)
   h. Filter Design Concepts (Section 6.0-6.5)
   i. The Discrete Fourier Transform (Section 8.0-8.9, 9.0-9.2)
