

## 6 Assignment 4 [Assignment ID: cpp\_containers]

### 6.1 Preamble (Please Read Carefully)

Before starting work on this assignment, it is **critically important** that you **carefully** read Section 1 (titled “General Information”) which starts on page 1-1 of this document.

### 6.2 Topics Covered

This assignment covers material primarily related to the following: memory management, intrusive and nonintrusive containers.

### 6.3 Problems — Part A — Nonprogramming Exercises

- 8.24 a b c [container selection]
- 8.26 [separation of construction/destruction and allocation/deallocation]
- 8.27 [array-based vs. node-based]
- 8.29 a b c [intrusive vs. nonintrusive containers]

### 6.4 Problems — Part B — Nonintrusive Set

B.1 *Ordered set class template based on sorted array* (`sv_set`). In this exercise, a class template called `sv_set` is to be developed that represents an ordered set of unique elements. This template has two parameters:

- (a) `Key`. The type of each of the elements in the set (i.e., the key type).
- (b) `Compare`. The type of the callable entity (e.g., function or functor) used to test if one key is less than another. Since the elements of the container are ordered, a comparison predicate must be provided by the container user to define the sorting criterion to be employed by the container. A callable entity `f` of type `Compare` can have the function-call operator applied with exactly two function arguments `x` and `y` of type `Key` and yields a return type of `bool`. The value returned by `f(x, y)` is `true` if `x` is less than `y` and `false` otherwise (i.e., `f` is a less-than predicate). Only a less-than predicate is provided by the user of `sv_set`, since all other relational operators (e.g., equal, not-equal, greater-than, greater-than-or-equal, and less-than-or-equal) can be synthesized from this single predicate. The type `Compare` need not be default constructible.

The interface for the `sv_set` class template is given in Listing 8.

The `sv_set` class template is somewhat similar to `std::set`, except that the underlying data structure used to store container elements differs. In the case of `std::set`, container elements are stored in a balanced (node-based) tree. In contrast, `sv_set` uses a dynamically-resizable array as the underlying data structure for storing the elements of the set. In order to facilitate efficient searching for elements, the elements of the array are stored in sorted order, namely, ascending order by key.

The dynamically-resizable array used by `sv_set` is somewhat similar to `std::vector`. The `std::vector` class template cannot be used in this exercise, however. The code for `sv_set` must directly manage the storage of the container elements (i.e., it cannot delegate this responsibility to another class such as `std::vector`). Global operator `new` and operator `delete` must be used in order to allocate storage for the container elements.

Listing 8: Interface for class template `sv_set`

```

1 namespace ra::container {
2
3     // A class representing a set of unique elements (which uses
4     // a sorted array).
5     template <class Key, class Compare = std::less<Key>>
6     class sv_set {
7     public:
8

```

```

9      // Note:
10     // In the time complexity specifications of various functions below,
11     // it is assumed that the following operations for the Compare type
12     // are constant time: default construction, destruction, copy
13     // construction and assignment, and move construction and assignment.
14
15     // A dummy type used to indicate that elements in a range are
16     // both ordered and unique.
17     struct ordered_and_unique_range {};
18
19     // The type of the elements held by the container. This is
20     // simply an alias for the template parameter Key.
21     using value_type = Key;
22     using key_type = Key;
23
24     // The type of the function/functor used to compare two keys.
25     // This is simply an alias for the template parameter Compare.
26     using key_compare = Compare;
27
28     // An unsigned integral type used to represent sizes.
29     using size_type = std::size_t;
30
31     // The mutable (random-access) iterator type for the container.
32     // This type must support all of the functionality associated
33     // with a random-access iterator.
34     using iterator = /* implementation defined */;
35
36     // The non-mutable (random-access) const_iterator type for
37     // the container.
38     // This type must support all of the functionality associated
39     // with a random-access iterator.
40     using const_iterator = /* implementation-defined */;
41
42     // Default construct a set.
43     //
44     // Creates an empty set (i.e., a set containing no elements)
45     // with a capacity of zero (i.e., no allocated storage for
46     // elements).
47     //
48     // Time complexity:
49     // Constant.
50     sv_set() noexcept(std::is_nothrow_default_constructible_v<
51         key_compare>);
52
53     // Construct a set with the specified comparison object.
54     //
55     // Creates an empty set (i.e., a set containing no elements)
56     // with a capacity of zero (i.e., no allocated storage for
57     // elements). The comparison object associated with the set is
58     // set to comp.
59     //
60     // Time complexity:
61     // Constant.
62     explicit sv_set(const Compare& comp);
63
64     // Construct a set from a range.
65     //

```

```
66     // Create a set consisting of the n elements in the range starting at
67     // first, where the elements in the range must be both unique and
68     // ordered with respect to the comparison operation embodied by the
69     // key_compare type. If the specified range is not both ordered and
70     // unique, the behavior of this function is undefined.
71     // The comparison object associated with the set is set to comp.
72     //
73     // Time complexity:
74     // Linear in n.
75     //
76     // Template constraints:
77     // The type InputIterator must meet the requirements of an input
78     // iterator.
79     //
80     // Note:
81     // The parameter of type ordered_and_unique_range is always ignored.
82     // This parameter is only present to allow for future expansion
83     // (i.e., adding a constructor that does not require an ordered
84     // and unique range).
85     template <class InputIterator>
86     sv_set(ordered_and_unique_range, InputIterator first,
87           std::size_t n, const Compare& comp = Compare());
88
89     // Move construct a set.
90     //
91     // Creates a new set by moving from the specified set other. After
92     // construction, the source set (i.e., other) is guaranteed to be
93     // empty.
94     //
95     // Time complexity:
96     // Constant.
97     sv_set(sv_set&& other) noexcept(
98         std::is_nothrow_move_constructible_v<key_compare>);
99
100    // Move assign a set.
101    //
102    // Assigns the value of the specified set other to *this via a move
103    // operation. After the move operation, the source set (i.e., other)
104    // is guaranteed to be empty.
105    //
106    // Iterator/reference invalidation:
107    // Move assignment may invalidate iterators/references to elements
108    // in the moved-from and moved-to containers.
109    //
110    // Time complexity:
111    // Linear in size().
112    //
113    // Preconditions:
114    // The objects *this and other are distinct.
115    sv_set& operator=(sv_set&& other) noexcept(
116        std::is_nothrow_move_assignable_v<key_compare>);
117
118    // Copy construct a set.
119    //
120    // Creates a new set by copying from the specified set other.
121    //
122    // Time complexity:
```

```
123     // Linear in other.size().
124     sv_set(const sv_set& other);
125
126     // Copy assign a set.
127     //
128     // Assigns the value of the specified set other to *this.
129     //
130     // Iterator/reference invalidation:
131     // Copy assignment may invalidate iterators/references to elements in
132     // the copied-to container.
133     //
134     // Time complexity:
135     // Linear in size() and other.size().
136     sv_set& operator=(const sv_set& other);
137
138     // Destroy a set.
139     //
140     // Erases all elements in the container and destroys the container.
141     //
142     // Time complexity:
143     // Linear in size().
144     ~sv_set();
145
146     // Get the comparison object for the container.
147     //
148     // Return value:
149     // Returns the comparison object for the container.
150     //
151     // Time complexity:
152     // Constant.
153     key_compare key_comp() const;
154
155     // Get an iterator referring to the first element in a set.
156     //
157     // Return value:
158     // Returns an iterator referring to the first element in the set if
159     // the set is not empty and end() otherwise.
160     //
161     // Time complexity:
162     // Constant.
163     const_iterator begin() const noexcept;
164     iterator begin() noexcept;
165
166     // Get an iterator referring to the one-past-the-end position in a
167     // set.
168     //
169     // Return value:
170     // Returns an iterator referring to the fictitious one-past-the-end
171     // element for the set.
172     //
173     // Time complexity:
174     // Constant.
175     const_iterator end() const noexcept;
176     iterator end() noexcept;
177
178     // Get the size of a set.
179     //
```

```
180     // Return value:
181     // Returns the number of elements in the set (i.e., the size
182     // of the set).
183     //
184     // Time complexity:
185     // Constant.
186     size_type size() const noexcept;
187
188     // Get the capacity of a set.
189     //
190     // Return value:
191     // Returns the number of elements for which storage is
192     // available (i.e., the capacity of the set). This value is
193     // always at least as great as size().
194     //
195     // Time complexity:
196     // Constant.
197     size_type capacity() const noexcept;
198
199     // Reserve storage for use by a set.
200     //
201     // Reserves storage in the container for at least n elements.
202     // After this function has been called with a value of n, it
203     // is guaranteed that no memory-allocation is needed as long
204     // as the size of the container does not exceed n.
205     // Calling this function has no effect if the capacity of the
206     // container is already at least n (i.e., the capacity of
207     // the container is never reduced by this function).
208     //
209     // Iterator/reference invalidation:
210     // The reserve member function may invalidate iterators/references
211     // to elements in the container if the capacity of the container is
212     // increased.
213     //
214     // Time complexity:
215     // At most linear in size().
216     void reserve(size_type n);
217
218     // Minimize the amount of storage used for the elements in a set.
219     //
220     // Reduces the capacity of the container to the container size.
221     // If the capacity of the container is greater than its size,
222     // the capacity is reduced to the size of the container.
223     // Calling this function has no effect if the capacity of the
224     // container does not exceed its size.
225     //
226     // Iterator/reference invalidation:
227     // The shrink_to_fit member function may invalidate
228     // iterators/references to elements in the container if the capacity
229     // of the container is decreased.
230     //
231     // Time complexity:
232     // At most linear in size().
233     void shrink_to_fit();
234
235     // Insert an element in a set.
236     //
```

```

237 // Inserts the element x in the set.
238 // If the element x is already in the set, no insertion is
239 // performed (since a set cannot contain duplicate values).
240 //
241 // Return value:
242 // The second (i.e., boolean) component of the returned pair
243 // is true if and only if the insertion takes place; and the
244 // first (i.e., iterator) component of the pair refers to
245 // the element with key equivalent to the key of x
246 // (i.e., the element inserted if insertion took place or
247 // the element found with an equal key if insertion did not
248 // take place).
249 //
250 // Iterator/reference invalidation:
251 // The insert member function may invalidate iterators/references that
252 // refer to elements in the container only if an insertion is actually
253 // performed (i.e., the element to be inserted is not already in the
254 // container). If an insertion is performed into a container whose
255 // size is less than its capacity, insert may invalidate only the
256 // iterators/references that refer to elements in the container with
257 // a value greater than the inserted element.
258 //
259 // Time complexity:
260 // Search logarithmic in size() plus insertion linear in either the
261 // number of elements with larger keys than x (if size() < capacity())
262 // or size() (if size() == capacity()).
263 std::pair<iterator, bool> insert(const key_type& x);
264
265 // Remove an element from a set.
266 //
267 // Erases the element referenced by pos from the container.
268 // Returns an iterator referring to the element following the
269 // erased one in the container if such an element exists or
270 // end() otherwise.
271 //
272 // Iterator/reference invalidation:
273 // The erase member function may invalidate iterators/references that
274 // refer to elements in the container with a value greater than the
275 // erased element.
276 //
277 // Time complexity:
278 // Linear in number of elements with larger keys than x.
279 iterator erase(const_iterator pos);
280
281 // Swap the contents of two sets.
282 //
283 // Swaps the contents of the container with the contents of the
284 // container x.
285 //
286 // Iterator/reference invalidation:
287 // The swap member function may invalidate iterators/references to
288 // elements in both of the containers being swapped.
289 //
290 // Time complexity: Constant.
291 void swap(sv_set& x) noexcept(
292     std::is_nothrow_swappable_v<key_compare>);
293

```

```

294     // Clear the contents of the set.
295     //
296     // Erases any elements in the container, yielding an empty container.
297     //
298     // Time complexity:
299     // Linear in size().
300     void clear() noexcept;
301
302     // Find an element in a set.
303     //
304     // Searches the container for an element with the key k.
305     // If an element is found, an iterator referencing the element
306     // is returned; otherwise, end() is returned.
307     //
308     // Time complexity:
309     // Logarithmic.
310     iterator find(const key_type& k);
311     const_iterator find(const key_type& k) const;
312
313     // Additional Remarks
314     //
315     // Iterator/reference invalidation:
316     // Each nonmutating (public) member function of sv_set is guaranteed
317     // not to invalidate iterators/references to elements in the
318     // container. The mutating (public) member functions of sv_set can
319     // only invalidate iterators/references as documented herein.
320     // Clearly, if an element is removed from the container, all
321     // iterators/references that refer to it will be invalidated.
322
323 };
324 }

```

The term “input iterator” is used in the above interface specification. If you are unsure as to what exactly an input iterator is, refer to the section of the lecture slides on containers, iterators, and algorithms. This section discusses iterator categories as well as input iterators specifically.

All of the necessary declarations and definitions for the `sv_set` class template should be placed in a header file called `include/ra/sv_set.hpp`.

Although the particular types to be used for the type members `iterator` and `const_iterator` are not specified, they must meet the requirements of a random access iterator. Raw pointer types may be used for these iterator types.

As indicated above, the `sv_set` class template must be placed in the namespace `ra::container`.

*Constructors and testing.* Since the code that tests the `sv_set` class template does not have access to the internal (i.e., private) state used to implement the class template, test code must rely heavily on the constructors of the class in order to place data in `sv_set` objects in order to perform testing. If any of the constructors of the class have bugs, this could easily result in every single test case failing. So, it is critically important that the constructors be very well tested. For example, the constructor that takes an `ordered_and_unique_range` and `iterator range` is used heavily by the instructor’s test code to place data in `sv_set` objects for testing. If this constructor were to work incorrectly, every test using this constructor would likely fail, due to placing the wrong data inside `sv_set` objects during part of the test.

Some functionality of the standard library that may potentially prove useful in this exercise includes: `std::copy`, `std::copy_backward`, `std::move`, `std::move_backward`, `std::uninitialized_copy`, `std::uninitialized_copy_n`, `std::uninitialized_move`, `std::uninitialized_move_n`, `std::uninitialized_fill`, `std::uninitialized_fill_n`, `std::destroy_at`, and `std::destroy`.

The code used to test the `sv_set` class template should be placed in a file called `app/test_sv_set.cpp`.

It is very strongly recommended that the ASan and LSan code sanitizers be employed during the testing of the code for this exercise. ASan is helpful for detecting bugs related to bad pointers, while LSan is helpful for detecting memory leaks. An option for enabling ASan and/or LSan can be placed in a file called `Sanitizers.cmake` and then included in the `CMakeLists.txt` file.

## 6.5 Problems — Part C — Intrusive List

C.1 *Intrusive doubly-linked list class template* (`list`). In this exercise, a class template called `list` is to be developed that represents an intrusive doubly-linked list with a sentinel node. The `list` class template relies on a (non-template) helper class called `list_hook`, which stores per-node list management information. The `list_hook` class (which is a non-template class) is used to store per-node information needed for list management (i.e., pointers to the successor and predecessor nodes). For a type `T` to be compatible with `list`, `T` must include a data member of type `list_hook`. The interfaces for the `list` class template and `list_hook` class are given in Listing 9.

Listing 9: Interface for class template `list`

```

1  namespace ra::intrusive {
2
3      // Per-node list management information class.
4      // This type contains per-node list management information (i.e., the
5      // successor and predecessor in the list). This class has the list class
6      // template as a friend. This type must contain pointers (of type
7      // list_hook*) to the next and previous node in the list.
8      class list_hook {
9      public:
10
11         // Default construct a list hook.
12         // This constructor creates a list hook that does not belong to any
13         // list.
14         list_hook();
15
16         // Copy construct a list hook.
17         // This constructor creates a list hook that does not belong to any
18         // list. The argument to the constructor is ignored. The copy
19         // construction operation is defined only so that types with list hooks
20         // are copy constructible. The list class itself never copies (or
21         // moves) a list hook.
22         list_hook(const list_hook&);
23
24         // Copy assign a list hook.
25         // The copy assignment operator is defined as a no-op. The argument to
26         // the operator is ignored. The copy assignment operation is defined
27         // only so that types with list hooks are copy assignable. The list
28         // class itself never copies (or moves) a list hook.
29         list_hook& operator=(const list_hook&);
30
31         // Destroy a list hook.
32         // The list hook being destroyed must not belong to a list. If the
33         // list hook belongs to a list, the resulting behavior is undefined.
34         ~list_hook();
35     };
36
37     // Intrusive doubly-linked list (with sentinel node).
38     template <class T, list_hook T::* Hook>

```

```
39     class list {
40     public:
41
42         // The type of the elements in the list.
43         using value_type = T;
44
45         // The pointer-to-member associated with the list hook object.
46         static constexpr list_hook T::* hook_ptr = Hook;
47
48         // The type of a mutating reference to a node in the list.
49         using reference = T&;
50
51         // The type of a non-mutating reference to a node in the list.
52         using const_reference = const T&;
53
54         // The mutating (bidirectional) iterator type for the list. This type
55         // must provide all of the functionality of a bidirectional iterator.
56         // If desired, the Boost Iterator library may be used to implement
57         // this type.
58         using iterator = /* implementation defined */;
59
60         // The non-mutating (bidirectional) iterator type for the list. This
61         // type must provide all of the functionality of a bidirectional
62         // iterator. If desired, the Boost Iterator library may be used to
63         // implement this type.
64         using const_iterator = /* implementation defined */;
65
66         // An unsigned integral type used to represent sizes.
67         using size_type = std::size_t;
68
69         // Default construct a list.
70         //
71         // Creates an empty list.
72         //
73         // Time complexity:
74         // Constant.
75         list();
76
77         // Destroy a list.
78         //
79         // Erases any elements from the list and then destroys the list.
80         //
81         // Time complexity:
82         // Either linear or constant.
83         ~list();
84
85         // Move construct a list.
86         //
87         // The elements in the source list (i.e., other) are moved from the
88         // source list to the destination list (i.e., *this), preserving their
89         // relative order. After the move, the source list is empty.
90         //
91         // Time complexity:
92         // Constant.
93         list(list&& other);
94
95         // Move assign a list.
```

```
96 //
97 // The elements of the source list (i.e., other) are swapped with the
98 // elements of the destination list (i.e., *this). The relative order
99 // of the elements in each list is preserved.
100 //
101 // Precondition:
102 // The objects *this and other are distinct.
103 //
104 // Time complexity:
105 // Constant.
106 list& operator=(list&& other);
107
108 // Do not allow the copying of lists.
109 list(const list&) = delete;
110 list& operator=(const list&) = delete;
111
112 // Swap the elements of two lists.
113 //
114 // Swaps the elements of *this and x.
115 // Swapping the elements of a list with itself has no effect.
116 //
117 // Time complexity:
118 // Constant.
119 void swap(list& x);
120
121 // Returns the number of elements in the list.
122 //
123 // Time complexity:
124 // Constant.
125 size_type size() const;
126
127 // Inserts an element in the list before the element referred to
128 // by the iterator pos.
129 // An iterator that refers to the inserted element is returned.
130 //
131 // Time complexity:
132 // Constant.
133 iterator insert(iterator pos, value_type& value);
134
135 // Erases the element in the list at the position specified by the
136 // iterator pos.
137 // An iterator that refers to the element following the erased element
138 // is returned if such an element exists; otherwise, end() is
139 // returned.
140 //
141 // Time complexity:
142 // Constant.
143 iterator erase(iterator pos);
144
145 // Inserts the element with the value x at the end of the list.
146 //
147 // Time complexity:
148 // Constant.
149 void push_back(value_type& x);
150
151 // Erases the last element in the list.
152 //
```

```

153     // Precondition:
154     // The list is not empty.
155     //
156     // Time complexity:
157     // Constant.
158     void pop_back();
159
160     // Returns a reference to the last element in the list.
161     //
162     // Precondition:
163     // The list is not empty.
164     //
165     // Time complexity:
166     // Constant.
167     reference back();
168     const_reference back() const;
169
170     // Erases any elements from the list, yielding an empty list.
171     //
172     // Time complexity:
173     // Either linear or constant.
174     void clear();
175
176     // Returns an iterator referring to the first element in the list
177     // if the list is not empty and end() otherwise.
178     //
179     // Time complexity:
180     // Constant.
181     const_iterator begin() const;
182     iterator begin();
183
184     // Returns an iterator referring to the fictitious one-past-the-end
185     // element.
186     //
187     // Time complexity:
188     // Constant.
189     const_iterator end() const;
190     iterator end();
191
192 };
193 }

```

All of the necessary declarations and definitions for the `list` class template should be placed in a header file called `include/ra/intrusive_list.hpp`.

Note that `list` and `list_hook` are contained in the namespace `ra::intrusive`. The `iterator` and `const_iterator` types must provide all of the functionality of a bidirectional iterator. This includes, amongst other things, prefix and postfix increment, prefix and postfix decrement, dereference operators (both unary **operator\*** and **operator->**). These iterator types must also behave in a const-correct manner. The code must be exception safe.

Determining the parent object from a pointer to one of its members requires nonportable (i.e., compiler-dependent) code. To simplify this exercise, the overloaded function `parent_from_member` is provided for making this determination. The relevant declarations are as follows:

```

namespace ra::util {
    template<class Parent, class Member>
    inline Parent *parent_from_member(Member *member,

```

```

    const Member Parent::* ptr_to_member);

template<class Parent, class Member>
inline const Parent *parent_from_member(const Member *member,
    const Member Parent::* ptr_to_member);
}

```

Given a pointer `member` to a subobject of some parent object (of type `Parent`) and a pointer-to-member `ptr_to_member` associated with that subobject, the function `parent_from_member` returns a pointer to the parent object of `*member`. The code for the above functions is provided in the file `parent_from_member.hpp`.

This file must be placed in the directory `include/ra` and the contents of this file should not be modified. The code provided for `parent_from_member` is only guaranteed to work for the compilers (GCC and Clang) used in the course. (The code may not work with other compilers, such as the MSVC compiler.)

The `list` class template should be tested with a variety of element types. A trivial example illustrating the use of the `list` class is given in Listing 10.

Listing 10: Example use of `list`

```

1  #include "ra/intrusive_list.hpp"
2
3  namespace ri = ra::intrusive;
4
5  struct Widget {
6      Widget(int value_) : value(value_) {}
7      int value;
8      ri::list_hook hook;
9  };
10
11 int main()
12 {
13     std::vector<Widget> storage;
14     storage.push_back(Widget(42));
15     ri::list<Widget, &Widget::hook> values;
16     for (auto&& i : storage) {
17         values.push_back(i);
18     }
19     values.clear();
20 }

```

The code used to test the `list` class template should be placed in a file called `app/test_intrusive_list.cpp`.

It is very strongly recommended that the ASan and LSan code sanitizers be employed during the testing of the code for this exercise. ASan is helpful for detecting bugs related to bad pointers, while LSan is helpful for detecting memory leaks. An option for enabling ASan and/or LSan can be placed in a file called `Sanitizers.cmake` and then included in the `CMakeLists.txt` file.
